

Retriever-Augmented Generation (RAG) Process

Simple Data for RAG

This document provides a simple example of data that can be used in a Retriever-Augmented Generation (RAG) process. The data includes a question and several short documents from which the RAG model can retrieve information to generate an answer.

Question:

"What is the capital of France?"

Documents:

1. France is a country in Western Europe.
2. The capital of France is Paris.
3. Paris is known for its cafe culture and the Eiffel Tower.

The RAG process would use the question to retrieve relevant documents, such as document 2, and then generate an answer based on the information found in the retrieved documents.
